

Date: 13 Jan 2025

CLASS TASK

Q1

Causes Of Climate Change

(from paragraph 2-6)

Paragraph 2

- Reliance on fossil fuels → • emissions from homes
- use of non-renewable energy

Paragraph 3

- deforestation reduces CO_2 absorption
- methane from farming practices

Paragraph 4

- Emission from planes and vehicles
- unsustainable travel methods

Date: 13 Jan 2025

Paragraph 5

- Melting glaciers
- Rising sea levels

Paragraph 6

- damage to eco-system
- increase in disease carrying species

Consequences Of Climate Change

Paragraph 2

- increased harmful greenhouse gases in the atmosphere

Paragraph 3

- loss of tree cover and agriculture output

Paragraph 4

- effect on health and travel

Paragraph 5

- floods and loss of marine life

Date: 13 Jan 2025

Paragraph 6

threats to wildlife habitats
extreme weather conditions

Q2

Summary

Climate change arises from human activities like consumption of fossil fuels, deforestation, harmful gases from travel industry. All these factors contribute to the release of greenhouse gases and the ability to absorb CO_2 reduces. Melting glaciers and rising sea-levels are also contributing to the climate change.

The consequences are significant. Greenhouse gases damage atmosphere while rising sea-levels cause flood and threaten marine life. Additionally, extreme weather conditions also disturb wildlife. Health risks are increasing and threatening both human and wildlife. Overall, climate change poses a severe threat to the planet and humanity.
