

Lab No 4

Lab Exercise

1. Create a query to display the employee name and the name of the department for each employee from the employee table in uppercase. Make sure all other columns retain their original case formatting.
2. Create a query to find the length of each employee's last name. Display the results for the query in three columns indicating the first name, the first letter of last name, and the length of the employee's last name.
3. Write a query to display employee names along with the length of their full names. Also concatenate the results in the format "John Doe [7]" for John Doe and label the column "Full Name Length".
4. Extract the first 3 characters of each employee's first name.
5. Write a query to round the product prices to the nearest integer and order the results by rounded price in descending order. Display product names along with the rounded product prices.
6. Display product prices rounded to the nearest tens place.
7. Find the remainder when product price is divided by 5. Display the price after rounding and truncating. Label each column `ROUNDED_PRICE` and `TRUNCATED_PRICE` respectively.
8. Display the order date truncated to the start of the month.
9. Concatenate employee name and rounded salary to nearest 100. Display the result in a column labelled `EMP_PAY_DETAILS` with the format "Doe, John | Salary 2000" for John Doe who earns 2000.
10. Write a query to find employees where the length of first name is greater than 5. Label the column `NAME_LENGTH_FILTER`.
11. Write a query to display employee names justified in the middle of a fixed width column using `LPAD` and `RPAD`.
12. Write the differences between `ROUND` and `TRUNC`. OR Write the differences between `INSTR` and `SUBSTR`.
